Resistant Self in Leadership: A Hermeneutical Conundrum

New Opportunity

Autoethnography offers leadership study opportunities as it allows the leader to become central to the research process by satisfying both an ontological and epistemological argument for an increased focus on the self (Spry, 2001; Humphreys, 2005). It therefore differs from ethnography in its ability to move on from the wide-angle view of the organisational context (‘other’) to the ‘focus on the inner, vulnerable and often resistant self’ (Boyle and Parry, 2007: 185). This has the ability to place the story of leadership as central figure within the story of leadership experience (Kempster, 2010). Co-produced autoethnography places a further emphasis on the subject by requiring the researcher to write about themselves and then be open to interrogation by themselves, reflectively, as well as their co-author, creating a co-produced narrative ‘sandwich’ (Ellis, 2004; Ellis and Bochner, 2000). The potential is to allow the organisational leader to ‘reveal a discovery’ through their narrative (Saldana, 2003: 224).

Autoethnography in the above sense represents a hermeneutical concern (or ‘language game’), receiving the self as text, in a context, and moving it between selves, although not to gain access to the ‘original intent of the author’ (the text in ‘our’ hands is transforming from the author in a new direction (Ricoeur, 1981). As such, in this domain: “all understanding is interpretation, and all interpretation takes place in the medium of language which would allow the object to come into words and yet is at the same time the interpreter’s own language” (Gadamer, 1979: 350).

Autoethnography is: “an autobiographical genre of writing and research that displays multiple layers of consciousness, connecting the personal to the cultural” (Ellis and Bochner, 2000: 733). “First-rate ethnography... seldom fails to offer up a number of critical, ironic insights into the world studied” (Van Maanen, 2011: 229). (NB: Auto (the first person voice); Ethno (the self in situation); Graphy (the text: journals, essays, social science prose)).

Hermeneutics represents a concern for grasping meaning beyond method (Gadamer, 1975); and understanding the wider experience of life beyond science, from the ordinary daily encounters, to art and philosophy, that together conspire to inform us on the matter of truth. Hermeneutical concern would seek, for example, to understand science and its method by interpreting them on a broader plane of interpreted truth (Gadamer, 1975).

Veracity

This emergent research offers an innovative means to deepen the pool of in-depth empirical research on strategic leadership (Kempster, 2008; Lowe and Gardiner, 2000; Waldman et al., 2006). The caution surrounding this and maybe any new development in social science is validity (Besso and Butz, 2004). This is partly due to there being too few studies that fully reveal their analysis (Bryman, 2004). The autoethnographic story sits between the continuum of science-facticity and meaning revealed through art (2010); as such, veracity stems from the data’s verisimilitude, that is, its ability to evoke a high level of plausibility by virtue of the story’s connectedness to life (Ellis and Bochner, 2000). Readers of good autoethnography will have a strong sense of the account ‘reading well’ (Ellington, 2001).

Strategic leadership

The research seeks to restore the plausible experience of leading via the revelation of autoethnography during late-modernity. Leadership research during the 20th century has frequently been positioned within the rationalist tradition (Lawler, 2005, 2007; Ashman and Lawler, 2008; Gibbs, 2010; Gibbs, 2011). This ‘received wisdom’ has led to dissonance for the leader whose lived experience of leading appears profoundly removed what has been written (Grunt, 2005; Alvesson and Svenningsson, 2003). Furthermore, management texts have struggled to offer a consistent or coherent shared understanding of what leadership is (Barker, 1999; Bennis and Nanus, 1986). (Published articles on leadership have risen from 156 in 1970/71 to 16,002 in 2001/02, showing the growing interest in this field). This ‘explosion’ of interest has served to add to the difficulty for the research community to agree coherent definitions surrounding leadership; this suggests new and more compelling methodologies are welcome (Senge, 1999).

The rise of the institution has given birth to the notion of the strategic leader, someone who looks beyond the immediate to create value over the long-term. There are limited autoethnographic accounts of the experience of ‘being a strategic leader’ (Kempster, 2010). The research considers the ‘whole self’. The suggestion here is that senior strategic leadership rarely brooks a divide between system-world and life-world and therefore research should consider the whole experience of leading by inviting first-person vignettes via ‘real-time accounts’ of ‘being a strategic leader’.

Debate: Ethical opportunity and difficulty – an appeal to reflexive writing?

It would be churlish to say this form of enquiry is without significant difficulty. The pressure for social science researchers to accord the right to the subject to interpret their own experience of the ‘drama’ of leading within organisational life leads to issues of exploitation of ‘others’ through narrative interpretation. Personal interpreted experience of the author struggles then to be a primary source of authority. These and other dilemmas open the debate to the question of to what extent do we all value the voice of the individual within society? The challenge then is one of fair dealing. There is an appeal here then for the nature of the writing to be reflexive; to the extent that it exposes the self as text and context.

PhD title:

Late-Modern Strategic Leadership and Self: A Critical Hermeneutic of Leadership
