Fault Detection and Diagnosis of Ball Bearing Using Advanced Vibration Analysis Techniques

Introduction
The antifriction bearing vibration measurement is one of the most common condition monitoring tools in regular use. By measuring the velocity, acceleration and frequencies emitted from a rolling bearing it is possible to tell its condition and the prospect of imminent failure.

Bearing Fault Characteristic Frequencies
The bearing characteristic defect frequency (BCF) depends on the geometry of the bearing.

![Diagram](image1)

Figure(1) Dimensions and Frequencies Related to the Characteristic Fault Frequencies.

- In this test the shaft rotational frequency calculated as in the table by using Matlab software. The signatures of failure appear in the vibration signals at frequencies named characteristic frequencies of bearing as in the equations below:

\[ f_{ORF} = \frac{N_b}{2} f_a \left[1 - \frac{D_B}{D_P} \cos \theta \right] \]  

(1)

\[ f_{IRF} = \frac{N_b}{2} f_a \left[1 + \frac{D_B}{D_P} \cos \theta \right] \]  

(2)

Where
- \( N_b \): number of balls.
- \( f_a \): shaft rotational frequency (Hz)
- \( D_B \): ball diameter (mm)
- \( D_P \): Pitch circle diameter (mm)
- \( \theta \): contact angle between inner and outer races – 0° (because there is no axial load).

3. Outer Race

Conclusion
- The initial result shows that, the envelope analysis spectrum is powerful method to detect, diagnosis and prognosis faults on the bearings.
- The bearing faults were significantly detected and diagnosed in both the inner race and outer race, which is the frequency value of the inner race fault are identified clearly at 134.8 Hz. Furthermore, this frequency value is very close to the calculated value at 135.2487 Hz.
- The frequency value of the outer race fault are identified clearly at 90.08 Hz. Furthermore, this frequency value is very close to the calculated value at 89.1582 Hz.

Future Work
- Perform and carry out some further experiments to study and investigate the performance of vibration signal analysis.
- Study and understand signal processing method such as (Empirical Mode Decomposition (EMD) and Cyclic Autocorrelation Function (CAF)).
