UNIVERSITY MERGERS IN ENGLAND: EFFECTS ON EFFICIENCY

EWEPAP Helsinki 2015
17th June 2015

Jill Johnes
University of Huddersfield

Mike Tsionas
Lancaster University
Outline of talk

- Introduction
- Background
- Reasons for merger in higher education
- Previous evidence on the consequences of mergers
- Model
- Results
- Conclusions
Introduction

Various forms of relationships can be observed in the English higher education (HE) sector:

• shared purchasing and services
• joint ventures and alliances
• full merger

This paper is concerned only with merger:

• ‘Merger: two or more partners combining to create a single institution, which may retain the name and legal status of one of them or be an entirely new legal entity.’ (HEFCE 2012, p11)
Introduction

• The current economic climate puts pressure on publicly-funded sectors to deliver more for less – including English HE
• Funding cuts can be absorbed by efficiency savings – possibly achieved by mergers (the efficiency theory)
Introduction

‘If institutional failure cannot be prevented …, then the Council will explore options such as mergers or takeovers led by other providers so that the new form becomes a going concern.’ (The Browne Report 2010 p46)

Throughout the world concentration of research funding is the name of the game,... How can you possibly compete as a single institution? Sir Sir Steve Smith, vice-chancellor of Exeter University, reported in *The Guardian* 16th October 2012)

Sir Roderick Floud former president of Universities UK believes that the number of universities in the UK should be cut by “at least one-third if not one-half” (*THE* 19-25 June 2014)
Some questions:

• Does the merger of 2 (or more) HEIs cause an increase in subsequent efficiency?

• Do the efficiency effects of merger take time to reap?
Introduction

Some problems:

- Historically there are comparatively few mergers in English higher education
- Merger activity and efficiency may themselves be endogenous
- So conventional econometric techniques of analysis may not be appropriate
This paper uses a Bayesian approach organised around the use of Markov chain Monte Carlo (MCMC) and proposes a method of analysis which

• Assesses efficiency of HEIs in England
• Takes into account the endogeneity of merger activity and inefficiency
• Quantifies the determinants of inefficiency and of merger activity
• Identifies whether there have been efficiency gains following merger
Background

- There have been very few mergers in English HE,
- These have varied in HEI composition
- These have largely been HEI-motivated
• This contrasts with the experience in Wales, for example:

  • “The Welsh government has stepped in to reduce the number of universities in Wales; maybe the English government will have to do the same.”

  • “…experience suggests that universities [in England] will not make such radical changes for themselves…”

• Sir Roderick Floud, *THE* 19-25 June 2014
Background

HE leaders’ predictions for the next 5-10 years

A number of institutional failures and insolvencies

Very likely  Quite likely  Quite unlikely  Most unlikely

Boxall and Woodgates (2014)
Reasons for merger in higher education

1. Efficiency theory

• A merger will occur if the merging HEIs believe they can be run more efficiently and effectively together than separately
  • Economies of scale
  • Economies of scope

• Efficiency theory is the main underlying cause of merger activity in GB (Rowley 1997)

• Prediction: merger leads to lower inefficiency
Reasons for merger in higher education

2. Strategy motive

• A merger will occur for reasons of survival and/or growth for at least one of the participants (Pritchard 1993; Rowley 1997; Harman and Meek 2002; Harman and Harman 2003)

• Prediction: inefficiency leads to merger
Reasons for merger in higher education

2. Strategy motive

- A merger will occur to enhance reputation (Skodvin 1999; Engwall 2007; Harman and Harman 2008; Tirronenen and Nokkala 2009; Aula and Tienari 2011)

- A merger will occur to improve international competitiveness (Mok 2005; Tirronenen and Nokkala 2009)

  - **Prediction:** merger leads to lower inefficiency
Previous evidence

- **Statistical analyses:**
  - China (Hu & Liang 2008; Mao 2009): efficiency, outcomes and productivity improved in year following merger; but did not in the second year
  - England (Johnes 2014):
    - the typical merged HEI is significantly more efficient than either pre-merger or non-merging HEIs
    - the effects can vary by the types of HEI participating in the merger; there are both winners and losers
Previous evidence

Statistical analyses: some caveats

• Previous statistical analyses fail to take into account
  • the complex relationship between inefficiency and merger
  • that other underlying characteristics might cause merging institutions to perform differently from non-merging ones
Previous evidence

Statistical analyses: some caveats

• Any measurement of efficiency typically does not incorporate any loss caused by the merger in learning experience on the part of students or staff
• does not incorporate any social costs arising from reduction in diversity between HEIs in the sector
Model

• Suppose: universities use $k$ inputs ($k = 1, ..., K$) to produce $l$ outputs ($l = 1, ..., L$)
• inputs and outputs are denoted by $X$ and $Y$ respectively
• subscript $it$ represents university $i$ in time period $t$ ($i = 1, ..., N; t = 1, ..., T$).
Model

- Inefficiency is estimated using a standard translog output distance function (ODF):
  \[ D(Y_{it}, X_{it}) = 1 \Rightarrow y_{1,it} = f(\tilde{y}_{m,it}, x_{s,it}) + v_{it} - u_{it} \]
- \( v_{it} \sim iidN(0, \sigma_v^2) \) represents the error
- \( u_{it} \sim iidN_+(0, \sigma_u^2) \) is the one-sided component, independently distributed and independent of the regressors
- lower case letters indicate logs, and \( \tilde{y}_m = y_m - y_{1,m} = 2, \ldots, M \)
Tendency to merge

\[ W_{it}^* = z'_{it} \gamma + \rho_1 \log u_{it} + \rho_2 \log u_{i,t-1} + \varphi W_{i,t-1}^* + \phi I_{i,t-1} + \varepsilon_{it}, \ \varepsilon_{it} \sim iid N(0,1) \]

\[ I_{it} = 1 \ (W_{it}^* \geq 0) \] is an observed merging indicator which is 1 if a merger took place and zero otherwise

\[ z_{it} \] is a vector of covariates

Tendency to merge also depends on current and past inefficiency and is also possibly persistent (autoregressive)
Inefficiency

\[ \log u_{it} = \alpha_0 + \alpha_1 \log u_{i,t-1} + z_{it}' \delta + \alpha_2 W_{i,t-1}^* + \alpha_3 I_{i,t-1} + \xi_{it}, \]
\[ \xi_{it} \sim \text{iid} N(0, \sigma_\xi^2) \]

• The dependence of technical inefficiency on \( W_{it}^* \) (latent merging indicator) and \( I_{it} \) (actual merging indicator) helps to distinguish between “latent” and “actual” effects of mergers.

• Allowing for persistent inefficiency implies that there may be adjustment costs and inertia in decreasing inefficiency which could be present even after a possible merger.
Model

- At time period $t-1$ HEIs $i$ and $j$ merge to become a new HEI ($n$).
- Inefficiency improvement is calculated as: $\Delta u_{nt} = u_{nt} - u_{n,t-1}$.
- Probabilities of such events are difficult to compute using the classical approach; Bayesian approach MCMC methods simplify the task.
- We estimate the ODF in an unrestricted manner and examine the probability that improvements in inefficiency have occurred.
- The required probability is $P(\Delta u_{nt} > 0 | \text{Data})$ marginally on the parameters to account for parameter-related uncertainty.
- MCMC: probabilities can be computed easily for all $n$ and $t$.
- These are probabilities of efficiency improvement after merger, assuming that mergers and inefficiency are endogenous.

Results: New model compared to other models
Results: Efficiency improvement

\[ P(\Delta u_{nt} > 0 | \text{Data}) \text{ where } \Delta u_{nt} = u_{nt} - u_{n,t-1} \]

Of 25 mergers, 11 have probability of efficiency improvement less than 70%
What are the characteristics of a “successful” merger?

- **Geography** (Skodvin 1999)?
- An examination of the distance between merging HEIs reveals no particular patterns.
- **Similar culture and mission** (HEFCE 2010)?
- Of the 11 mergers with probability of efficiency improvement < 70%, 6 are between HEIs of the same type.
- **Grants** from HEFCE’s Strategic Development Fund?
- For example: the Manchester merger attracted a grant of £10 million plus a further £10 million in repayable grants.
Results: Efficiency of merged HEIs over time

- Efficiency of merged institutions after T periods for T=0, T=1, T=2,
- Efficiency of merged institutions after T periods for T=3, T=4, T=5,
- Efficiency of merged institutions after T periods for T=6, T=7, T=8,
- Efficiency of merged institutions after T periods for T=9, T=10, T=11.
Conclusions

- Inefficiency is significantly, positively affected by tendency to merge and action of merging (in the previous time period)
- Tendency to merge is not significantly affected by inefficiency
- The new model taking into account endogeneity of merging and inefficiency performs better than 3 nested models which do not
- Inefficiency and tendency to merge are positively, significantly related to the size of HEI; the relationship is non-linear
Conclusions

• Merging HEIs are typically more efficient than pre- and non-merging HEIs

• Efficiency improvement is not experienced across all mergers: 11 of 25 mergers examined have probability < 0.70 that efficiency does not improve in time $t$ compared to $t-1$ (year of merger).

• Mean efficiency peaks soon after merger, and plateaus at a value of 0.94 to 0.95; dispersion around the mean is wide particularly in the 3 to 5 periods after merger.
Conclusions

- **Caveats:** measurement of efficiency does not incorporate
  - loss imposed by the merger in terms of learning (and teaching) experience on the part of students (or staff)
  - possible social costs arising from reduction in diversity between HEIs in the sector caused by merging
  - regional economic effects of HEI closures

Thank you!
