## 1. Introduction

1,2,4-Oxadiazoles have attracted attention due to their biological activity, often related to their bioisosteric nature and use in medicinal chemistry. ${ }^{1}$ This area has been extensively reviewed ${ }^{1}$ and a selection of recent compounds of interest is shown in Figure 1. Compound 1 is one of a series of 1,2,4oxadiazoles that are potent EthR inhibitors that boost ethionamide activity in the treatment of multi-drug resistant tuberculosis. ${ }^{2}$ Compound 2 is of interest as a combretastatin A-4 analogue with higher efficacy as an antimitotic agent. ${ }^{3}$ Thiol linked 1,2,4-oxadiazoles 3 that have electron withdrawing aryl substituents show great potency towards androgen independent prostrate cancer cell-lines. ${ }^{4}$ Compound 4 is an excellent in vivo sphingosine phosphate receptor-1 $\left(\mathrm{S}_{1} \mathrm{P}_{1}\right)$ selective modulator that suppresses the development of autoimmune diseases including multiple sclerosis and adjuvant-induced arthritis models. ${ }^{5}$ Compound 5 is representative of a potent class of tankyrase (TNKS1/2) dual inhibitors that show no activity at poly(ADPribose) polymerase (PARP1 and 2) domains, and are inhibitors of the Wnt pathway whose dysregulation is a key priority in multiple diseases including several cancers. ${ }^{6}$ In 2011 the first 1,2,4-oxadiazole natural products, phidianidines $\mathrm{A}(\mathbf{6}, \mathrm{X}=\mathrm{Br})$ and $B(6, X=H)$, were isolated ${ }^{7 \mathrm{a}}$ - from a marine opisthobranch source - and their synthesis reported shortly thereafter. ${ }^{7 \mathrm{~b}} 1,2,4-$ Oxadiazoles are also of interest in materials research ${ }^{1}$ with recent examples including bent-core ${ }^{8}$ and bent-rod liquid crystals ${ }^{9}$ with stable liquid phases over broad temperature ranges. 3-Nitro-5-
substituted-1,2,4-oxadiazoles such as compound 7 are reported as "explosophoric" energetic, insensitive high explosives. ${ }^{10}$ Finally, the use of pyridyl-1,2,4-oxadiazoles ${ }^{11}$ and bis-1,2,4-oxadiazole ${ }^{12}$ as ligands that chelate $\mathrm{Ni}^{\text {II }}, \mathrm{Cu}{ }^{\mathrm{II}}, \mathrm{Zn}^{\mathrm{II}}$ and $\mathrm{Pd}^{\text {II }}$ has been reported, together with a report that bis(pyridyl)-1,2,4-oxadiazole $\mathrm{Cu}^{\mathrm{II}}$ complexes display promising activity as DNA groove binders. ${ }^{13}$

Figure 1: A selection of 1,2,4-oxadiazoles of recent interest

1,2,4-Oxadiazoles are most commonly constructed using 1,3dipolar cycloadditions between nitrile oxides and nitriles ${ }^{1,14}$ or from the reactions of a nitrile-derived amidoxime with a carboxylic acid derivative. ${ }^{1,15}$ In this report, we show that 5 -alkylthio-1,2,4-oxadiazoles 10 can be obtained from a formal [2+2]-cycloreversion of the oxadiazabicyclo[3.2.0]heptenes 9 [Scheme 1] which in turn are readily constructed from the 1,3dipolar cycloaddition of a nitrile oxide to a 4 -aryl-1-azetine 8. In this process, the 1 -azetine acts as an equivalent for the nitrile species $\mathrm{R}^{1} \mathrm{~S}-\mathrm{CN}$, known as either an alkyl thiocyanate or an alkyl thiocyanic ester. ${ }^{16}$

Scheme 1: Synthesis of 1,2,4-oxadiazoles from 1-azetines

## 2. Results and Discussion

This work has its origins in our studies [Scheme 2] that focused upon the synthesis of azabicycles $\mathbf{1 3}$ from the reaction of cyclic imines 11 with cyclopropenones 12, where the latter function as all-carbon 1,3-dipole equivalents $14 .{ }^{17}$ When the imine 11 was a 4 -aryl-1-azetine the intermediate bicycles 13a (n $=1)$ gave the tetra-substituted pyridines $\mathbf{1 6} .^{18}$ We postulated that this transformation proceeded through a [2+2] cycloreversion to give a non-isolable, high-energy azacyclopentadienone 15 and a styrene. The styrene and intermediate 15 then recombine by Diels-Alder reaction, followed by chelotropic extrusion of carbon monoxide and aromatisation to yield the pyridine, paralleling the synthesis of benzenes from cyclopentadienones. The ease with which this process produced the proposed intermediate $\mathbf{1 5}$ led us look at this as a route for the formation of 1,2,4-oxadiazoles, which we anticipated would be isolable and not undergo further reaction.

Scheme 2: Pyridines from azacyclopentadienones ${ }^{19}$

As shown in Scheme 3 and Table 1, the 1 -azetines 8 required for this study were synthesised from the alkylation of the corresponding thio- $\beta$-lactams 18 with Meerwein's salts or dimethyl sulfate. The thio- $\beta$-lactams were obtained from the
reaction of the $\beta$-lactam 17 with either Lawesson's reagent, ${ }^{19}$ or the much more convenient and odour-free $\mathrm{P}_{4} \mathrm{~S}_{10}$-pyridine complex developed by Bergman. ${ }^{20}$ The $\beta$-lactams 17 were easily available from the reaction of chlorosulfonyl isocyanate (CSI) with the relevant styrene. ${ }^{21}$ The nitrile oxides were generated by the standard route ${ }^{22}$ of dehydrochlorination of the chloro-oximes 19. This approach produced seven examples, $9 \mathbf{a}-\mathbf{c}$ and $9 \mathbf{e}-\mathbf{h}$, of the desired oxadiazabicycles $\mathbf{9}$ as summarised in Table 1. As seen in Table 1, the oxadiaza[3.2.0]bicycles 9 were produced in yields of $43-72 \%$. It is worth noting that each of the adducts 9 was a single diastereoisomer with (nOesy) cis stereochemistry between the $\mathrm{Ar}^{1}$ and $\mathrm{SR}^{1}$ groups, presumably a result of the incoming 1,3-dipole approaching trans to the existing $\mathrm{Ar}^{1}$ group, thus forcing the $\mathrm{SR}^{1}$ group cis to the $\mathrm{Ar}^{1}$ substituent. The treatment of the azido compound 9a $\left(\mathrm{Ar}^{2}=2-\mathrm{N}_{3}-\mathrm{C}_{6} \mathrm{H}_{4}\right)$ with triphenylphosphine followed by hydrolysis gave the corresponding amino species 9d $\left(\mathrm{Ar}^{2}=2-\mathrm{NH}_{2}-\mathrm{C}_{6} \mathrm{H}_{4}\right)$ in $70 \%$ overall yield, giving us access to an eighth example of an oxadiaza[3.2.0]bicycle.

When heated to reflux in toluene, all but one of the oxadiazabicycles 9a-h formed the 5-alkylthio-1,2,4-oxadiazole 10 (Scheme 3), in good to excellent yields (see Table 1). The one exception was compound $9 \mathbf{d}$ which proved to be stable, possibly as a result of increased stability resulting from intramolecular hydrogen bonding between the amino group and $N-2$ or $N-4$ of the oxadiazolidine ring (as shown for $N-2$ in Scheme 3). The products of these reactions, 5 -alkylthio- $1,2,4$-oxadiazoles 10, are a class of 1,2,4-oxadiazole that have attracted no other synthetic approaches to our knowledge. ${ }^{1}$ We are currently exploring the synthetic utility of the 5 -alkylthio-1,2,4-oxadiazoles $\mathbf{1 0}$.

Scheme 3: The synthesis of 5-alkylthio-1,2,4-oxadiazoles 10

A further example of a 5-alkylthio-1,2,4-oxadiazole, the aryltriazole compound $\mathbf{1 0 i}$ (Scheme 4), was obtained by reacting the azido compound 9a with dimethylacetylene dicarboxylate (DMAD) in toluene for 20 hours at reflux. The product presumably forms through consecutive [2+2]-cycloreversion and azide 1,3-dipolar cycloaddition. The presumed intermediate of the cycloaddition-first pathway (Pathway A, Scheme 4), compound 9i, could not be detected, whereas TLC indicated that the 1,2,4-oxadiazole 10a was present in small amounts, implying that the cycloreversion-first pathway (Pathway B, Scheme 4) represents the correct sequence of events. Compound $\mathbf{1 0 i}$ could be obtained in $65 \%$ yield by treating 1,2,4-oxadiazole 10a with DMAD in toluene for 4 hours at reflux confirming that it can act

## 3. Conclusions

1,3-Dipolar cycloadditions of nitrile oxides to 4-aryl-2-alkylthio-1-azetines gave oxadiazabicyclo[3.2.0]heptenes that underwent a formal [2+2]-cycloreversion and loss of a styrene to furnish 5 -alkylthio- 3 -aryl-1,2,4-oxadiazoles. The use of 2 -azidobenzonitrile oxide allowed subsequent 1,3-dipolar cycloaddition of DMAD to the azide ("click" reaction) in order to furnish the 1 -(1,2,4-oxadiazolo)-2-(1,2,3-triazolo)-substituted benzenes 10i. In these processes, a 2 -alkylthio-1-azetine functions as an equivalent of the alkyl thiocyanate or alkyl thiocyanic ester functional group. We are currently exploring the properties and synthetic utility of the 5 -alkylthio-1,2,4-oxadiazoles 10, and are also extending our studies to look at other nitrilium betaines and other 1 -azetines. As part of a recently initiated programme of study ${ }^{23}$ focused upon 1,2,4-oxadiazoles as ligands in supramolecular coordination chemistry, we are also exploring the ligand properties of compound $\mathbf{1 0 i}$.

Scheme 4: Routes to the 3-(triazoloaryl)-1,2,4-oxadiazole 10i

P.), and Dr Neil McLay, University of Huddersfield, for NMR and mass spectroscopic support. We are grateful to the EPSRC National Mass Spectrometry Service, University of Wales, Swansea for HRMS.

## 4. Experimental Section

All reactions were conducted using oven-dried glassware under nitrogen dried through $4 \AA$ molecular sieves and delivered through a gas manifold. Work-up procedures were carried out in air. All solvents were purchased from Fisher Chemicals and were of analytical grade. Anhydrous grade solvents were freshly distilled using a continuous still under nitrogen. Acetone was dried overnight over $3 \AA$ molecular sieves ( $10 \% \mathrm{w} / \mathrm{v}$ ), and then distilled over freshly activated $3 \AA$ Á molecular sieves over 3-4 h. Chloroform was dried over $4 \AA$ molecular sieves or distilled over
phosphorus pentoxide ( $3 \% \mathrm{w} / \mathrm{v}$ ). Dichloromethane, ethyl acetate and toluene were distilled over calcium hydride ( $5 \% \mathrm{w} / \mathrm{v}$ ) over 46 h . Diethyl ether and THF were pre-dried over sodium wire, and then distilled over sodium wire ( $1-2 \% \mathrm{w} / \mathrm{v}$ ) with benzophenone $(0.2-0.3 \% \mathrm{w} / \mathrm{v})$ as an indicator. Any other anhydrous solvents were purchased from Acros or Sigma-Aldrich. All reactions were monitored by TLC, which was carried out on 0.20 mm Macherey-Nagel Alugram ${ }^{\circledR}$ Sil $\mathrm{G} / \mathrm{UV}_{254}$ silica gel-60 $\mathrm{F}_{254}$ precoated aluminium plates and visualisation was achieved using UV light and / or vanillin stain. Column chromatography was performed on Merck silica gel ( $0.063-0.200 \mathrm{~mm}, 60 \AA$ ). NMR spectra were recorded on a Bruker DPX-400 instrument or on a Bruker Avance 500. IR spectra were recorded on a Nicolet 380 FT-IR instrument as a thin film for oils, a drop for liquids or neat for solids. Mass spectra were recorded on a Bruker Daltonics micrOTOF mass spectrometer operating at a positive ion mode under an electrospray ionisation (ESI + ) method. High resolution mass spectra were recorded on a Finnegan MAT 900 XTL instrument operated by the EPSRC National Mass Spectrometry service at the University of Swansea. Melting points were recorded on a Gallenkamp apparatus. 1-Azetines 8a-h were
synthesised as reported previously, ${ }^{18}$ and gave consistent spectroscopic data.

### 4.1. 2-(2-Azidophenyl)-5-ethylthio-7-phenyl-4,1,3-oxadiazabicyclo[3.2.0]hept-2-ene 9a

To 2-ethylthio-4-phenyl-1-azetine (8a) ${ }^{18} \quad(176 \mathrm{mg}, 0.920$ mmol ) and 2-azidobenzohydroximoyl chloride ${ }^{24}$ (19a) ( 181 mg , $0.921 \mathrm{mmol})$ was added triethylamine $(0.153 \mathrm{~mL}, 112 \mathrm{mg}, 1.10$ mmol ) diluted in diethyl ether ( 5 mL ) dropwise over 5 hours at room temperature. The mixture was stirred overnight under an inert atmosphere. The solution was filtered and the solvent was removed in vacuo to give the crude product as an orange oil which was purified by gravity silica chromatography $\left(\mathrm{R}_{\mathrm{f}}=0.3\right.$; PE $40-60{ }^{\circ} \mathrm{C} / \mathrm{EtOAc}: 9 / 1$ ) to give the product as a single diastereoisomer as a yellow oil ( $206 \mathrm{mg}, 63 \%$ ).

HRMS $(\mathrm{m} / \mathrm{z})[\mathrm{M}+\mathrm{H}]^{+}$for $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{OS}$ calculated $=$ 207.1404, measured $=207.1407$.
4.12. 3-(4-Methoxyphenyl)-5-methylthio-1,2,4-oxadiazole 10e/f/h

Obtained as a clear, yellow oil ( $45 \mathrm{mg}, 88 \%$ yield), $(52 \mathrm{mg}$, $82 \%$ yield) and ( $34 \mathrm{mg}, 87 \%$ yield), as per the method for compound 10a, from 2-(4'-methoxyphenyl)-5-methylthio-7-phenyl-4,1,3-oxadiazabicyclo[3.2.0]hept-2-ene ( $9 \mathrm{e}, 80 \mathrm{mg}$ ) or 2-(4'-methoxyphenyl)-5-methylthio-7-(4'-tolyl)-4,1,3-
oxadiazabicyclo[3.2.0]hept-2-ene ( $\mathbf{9 f}, \quad 100 \mathrm{mg}$ ), or 2-(4'-methoxyphenyl)-5-methylthio-7-(2'-naphthyl)-4,1,3-
oxadiazabicyclo[3.2.0]hept-2-ene ( $\mathbf{9 h}, 70 \mathrm{mg}$ ), respectively, after silica chromatography (eluent: petroleum ether: ethyl acetate, 16:1); $\mathrm{R}_{\mathrm{f}}=0.5\left(\mathrm{PE} 40-60^{\circ} \mathrm{C} / \mathrm{EtOAc}: 10 / 1\right)$.

IR $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2919(\mathrm{~m}), 1611$ (s), 1509 ( s$), 1466$ (m), 1422 (m), 1346 (m), 1297 (m), 1250 ( s$), 1198$ (m), 1117 (m), 1027 (m), 833 ( s ,, 758 ( s ).
${ }^{1} \mathrm{H}$ NMR: $\quad \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.99(2 \mathrm{H}, \mathrm{d}, J=8.0, \mathrm{ArH})$, $6.98(2 \mathrm{H}, \mathrm{d}, J=8.0, \mathrm{ArH}), 3.85(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 2.78(3 \mathrm{H}, \mathrm{s}, \mathrm{SMe})$.
${ }^{13} \mathrm{C}$ NMR: $\delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 178.1$ (C, oxadiazole), 168.3 (C, oxadiazole), 162.0 (C, Ar), 129.1 (CH, Ar), 119.0 (C, Ar), $114.2(\mathrm{CH}, \mathrm{Ar}), 55.4\left(\mathrm{O}-\mathrm{CH}_{3}\right), 14.2\left(\mathrm{~S}-\mathrm{CH}_{3}\right)$.

HRMS $(\mathrm{m} / \mathrm{z})[\mathrm{M}+\mathrm{Na}]^{+}$for $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{NaO}_{2} \mathrm{~S}$ calculated $=$ 245.0355, measured $=245.0350$.

### 4.13. 3-(4-Methoxyphenyl)-5-ethylthio-1,2,4-oxadiazole 10g

Obtained as a clear, yellow oil ( $40 \mathrm{mg}, 81 \%$ yield) as per the method for compound 10a from 2-(4'-methoxyphenyl)-5-ethylthio-7-(4'-tolyl)-4,1,3-oxadiazabicyclo[3.2.0]hept-2-ene ( $\mathbf{9 g}$, 80 mg ) after silica chromatography (eluent: petroleum ether: ethyl acetate, 16:1); $\mathrm{R}_{\mathrm{f}}=0.5$ (PE 40-60 ${ }^{\circ} \mathrm{C} / \mathrm{EtOAc}: 10 / 1$ ).

IR $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2920(\mathrm{w}), 1611$ (s), 1505 (s), $1420(\mathrm{~m}), 1348$ (s), 1299 (m), 1250 (s), 1171 (m), 1028 (m), 838 (m), 753 (m).
${ }^{1} \mathrm{H}$ NMR: $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ : $7.98(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=8.1 \mathrm{~Hz}, \mathrm{ArH})$, $6.96(2 \mathrm{H}, \mathrm{d}, J=8.1 \mathrm{~Hz}, \mathrm{ArH}), 3.86(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.32(2 \mathrm{H}, \mathrm{q}$, $\left.J=7.9 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.52\left(3 \mathrm{H}, \mathrm{t}, J=7.9 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$.
${ }^{13} \mathrm{C}$ NMR $\delta\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): 177.6$ (C, oxadiazole), 168.3 (C, oxadiazole), $162.0(\mathrm{C}, \mathrm{Ar}), 129.0(\mathrm{CH}, \mathrm{Ar}), 119.0(\mathrm{C}, \mathrm{Ar})$, $114.2(\mathrm{CH}, \mathrm{Ar}), 55.4\left(\mathrm{O}-\mathrm{CH}_{3}\right), 27.3\left(\mathrm{~S}-\mathrm{CH}_{2}\right), 14.8\left(\mathrm{~S}-\mathrm{CH}_{2} \mathrm{CH}_{3}\right)$.

MS $(\mathrm{m} / \mathrm{z}) 259.0[\mathrm{M}+\mathrm{Na}]^{+}, 731.2\left[\mathrm{M}_{2}+\mathrm{Na}\right]^{+}$.
HRMS $(m / z)[\mathrm{M}+\mathrm{Na}]^{+}$for $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{NaO}_{2} \mathrm{~S}$ calculated $=$ 259.0511 , measured $=259.0518$.
4.14. Synthesis of 1,2,3-triazole 10i: Reaction of 2-(2-azidophenyl)-5-ethylthio-7-phenyl-4,1,3-oxadiazabicyclo[3.2.0]-hept-2-ene with DMAD

2-(2-Azidophenyl)-5-ethylthio-7-phenyl-4,1,3-oxadiaza bicyclo[3.2.0]hept-2-ene (9a) (110 mg, 0.313 mmol$)$ and dimethylacetylene dicarboxylate (DMAD) ( $42 \mu \mathrm{~L}, 49 \mathrm{mg}, 0.34$ mmol, 1 eq.) were dissolved in toluene ( 5 mL ) and the solution was heated at reflux under nitrogen overnight. The solvent was removed in vacuo to give the crude product as an orange oil, which was purified by gravity silica chromatography $\left(\mathrm{R}_{\mathrm{f}}=0.3\right.$; PE $40-60{ }^{\circ} \mathrm{C} /$ EtOAc: $10 / 1$ ) to give the triazole derivative $\mathbf{1 0 i}$ as a yellow oil ( $50 \mathrm{mg}, 41 \%$ ).

IR $v_{\text {max }}\left(\mathrm{cm}^{-1}\right) 2954$ (w), 1735 (s, C=O), 1557 (w), 1507 (m), 1474 (m), 1448 (m), 1358 (s), 1290 (m), 1232 (m), 1181 (m), 1105 (m), 1078 (m), 1004 (w), 963 (w), 826 (w), 809 (w), 777 (w), 758 (m), 669 (w).
