COSTS AND EFFICIENCY IN ENGLISH HIGHER EDUCATION

AN ANALYSIS USING LATENT CLASS STOCHASTIC FRONTIER MODELS

5th Workshop on Efficiency and Productivity Analysis

Porto 5th October 2015

Jill Johnes, University of Huddersfield UK **Geraint Johnes**, Lancaster University UK

Inspiring tomorrow's professionals

Outline of talk

- 1. Introduction
- 2. Literature review
- 3. Conceptual issues
- 4. Model specification
 - Defining the variables
 - Estimation method

5. **Results**

- Estimated average costs
- Economies of scale
- Economies of scope
- Efficiencies

6. Conclusions

https://www.gov.uk/government/uploads/system/uploads/attachment_data /file/237411/bis-13-918-efficiency-in-higher-education-sector.pdf

1. Introduction

- HEIs receive public money
 - funding body grants
 - non-payment of tuition fees
- Reduced incentive to be efficient
- Need to assess efficiency of higher education institutions (HEIs)

 Cost functions provide information on efficiency, economies of scale and economies of scope

The English higher education sector comprises very diverse groups of HEIs:

- ✓ Pre-1992 universities: degree programmes in all academic subjects; research mission
- ✓ Post-1992 universities: degree programmes in academic and vocational subjects; some have a research mission
- ✓ Former colleges of HE: small, specialist HEIs; most do not have a research mission

1. Introduction

Questions

- What are average and marginal costs of outputs of English HEIs?
- Are there economies of scale and scope in English HE?
- How efficient are English HEIs?
- How does 'mission group' affect costs?
- Are there other factors which might affect HEIs' costs?

- USA: Cohn *et al* (1989)
- UK: Glass *et al* (1995a; 1995b); Johnes (1996; 1997; 1998); Izadi *et al* (2002); Stevens (2005); Johnes *et al* (2005; 2008); Thanassoulis *et al* (2011)
 - \checkmark Allow for economies of scale and scope
 - ✓ Disaggregate output by subject and by type of HEI
 - ✓ Limited analysis of additional variables
 - ✓ Increasing use of panel data
 - ✓ Generally cover a subset of the English HE sector

- USA: Cohn *et al* (1989)
- UK: Glass *et al* (1995a; 1995b); Johnes (1996; 1997; 1998); Izadi *et al* (2002); Stevens (2005); Johnes *et al* (2005; 2008); Thanassoulis *et al* (2011)
 - ✓ Relatively low efficiency in panel data studies
 - ✓ Efficiency varies by type of university
 - ✓ Ray economies of scale; diseconomies of scope
 - Student quality, location of HEI are not important determinants of costs

Most recent developments

- UK: Johnes & Johnes (2009) use a random parameter model (RPM) with stochastic frontier analysis (SFA)
 - ✓ Allows HEIs to have different objectives; the model allows the coefficient on one output to vary by HEI
 - Can be difficult to estimate the parameters of a RPM SFA
- Findings:
 - ✓ HEIs are heterogeneous in terms of both cost structure and efficiency

Most recent developments

- USA: Agasisti & Johnes (2009) use latent class model (LCM) with SFA
 - Rather than calculating cost functions by predefined groups, they use the LCM method to let the data suggest distinct groups
- Findings:
 - ✓ HEIs are heterogeneous in terms of both cost structure and efficiency

3. Conceptual Issues

Functional form of cost function

- a) Linear: $C = \alpha_0 + \sum_i \beta_i y_i$
- **b)** CES: $C = \alpha_0 + \left[\sum_i \beta_i y_i^{\delta_i}\right]^{\rho} + \nu$
- c) Quadratic: $C = \alpha_0 + \sum_i \alpha_i F_i + \sum_i \beta_i y_i + \left(\frac{1}{2}\right) \sum_i \sum_j \gamma_{ij} y_i y_j + \nu$
- d) Hybrid translog:

$$\ln C = \alpha_0 + \sum_i \alpha_i \ln(w_i) + \sum_k \beta_k [(y_k^{\vartheta} - 1)/\vartheta] + \frac{1}{2} \sum_i \sum_j \gamma_{ij} \ln w_i \ln w_j + \frac{1}{2} \sum_k \sum_l \delta_{kl} [(y_k^{\vartheta} - 1)/\vartheta] [(y_l^{\vartheta} - 1)/\vartheta] + \sum_i \sum_k \rho_{ik} \ln w_i [(y_k^{\vartheta} - 1)/\vartheta] + v$$

3. Conceptual Issues

- Average incremental cost (AIC) $AIC(y_i) = [C(y) - C(y_{N-i})]/y_i$
- Ray economies of scale

$$S_R = \frac{C(y)}{\sum_i y_i C_i(y)}$$

where
$$C_i(y) = \frac{\partial C(y)}{\partial y_i} = MC_i$$

✓ If $S_R > 1$ (< 1) then there are economies (diseconomies) of scale

Note that C(y) is the total cost of producing all N outputs.

3. Conceptual Issues

• Product-specific economies of scale $S_i(y) = AIC(y_i)/C_i(y)$

- ✓ If $S_i > 1$ (< 1) then there are economies (diseconomies) of scale for product *i*
- Economies of scope

 $S_G = [\sum_i C(y_i) - C(y)]/C(y)$

✓ If $S_G > 0$ (< 0) then global economies (diseconomies) of scope exist for producing the outputs jointly rather than in separate institutions

a) Outputs TEACHING

- **UGMED** FTE undergraduates in medicine and dentistry (000s)
- UGSCI FTE undergraduates in sciences other than medicine and dentistry (000s)
- UGARTS FTE undergraduates in non-science subjects (000s)
- **PG** FTE postgraduates in all subjects (000s)

a) Outputs RESEARCH

 RESEARCH Quality related funding and research grants

THIRD MISSION

IPINCOME Income from third mission activity

Note that all squares and interactions of UGMED, UGSCI, UGARTS, PG and RESEARCH are included; the square of IPINCOME and interaction of IPINCOME only with RESEARCH are included.

b) Additional factors QUALITY OF STUDENTS

 MEANSAL Mean salary of graduates 6 months after graduation

QUALITY OF TEACHING

 NSS Percentage saying yes to the question: 'Overall, I am satisfied with the quality of the course' from the National Student Survey

b) Additional factors WIDENING PARTICIPATION

 LOWPNO Number of FT UG entrants from 'low participation' neighbourhoods

ESTATES COSTS

 LISTED The total area of the HEI identified as a listed building

b) Additional factors DUMMY VARIABLES

- OXBRIDGE Dummy variable: 1 if HEI is Oxford or Cambridge
- YEAR Dummy for each year in the study (apart from the last)

• SFA

For HEI *i* at time *t*: $C_{it} = f(y_{1it}, \dots, y_{kit}) + v_{it} + u_{it}$

• SFA with latent class model (LCM) For HEI *i* at time *t*, *m* classes: $C_{it} = f_m(y_{1it}, ..., y_{kit}) + v_{it,m} + u_{it,m}$

- Panel data from 2003/04 to 2010/11 covering around 120 HEIs
- Model estimates for 3 time periods: 2003/04 to 2004/05, 2005/06 to 2007/08 and 2008/09 to 2010/11
- Comparison of results from applying SFA and SFA LCM
- Efficiency is allowed to vary over time within any given model
- Data are largely from the Higher Education Statistics Agency
- All money units are in 2011 values

5. Results HIDDFRSE nspiring tomorrow's professionals AIC from SFA linear model (2011 £)

Is λ significantly	YES	NO	NO	YES	
different from zero at					
the 5% significance					
level?					

6. Conclusions

- Results for the earliest time period seem unreliable
- Estimates of AICs from SFA models (linear and quadratic) for the remaining periods seem plausible
- Estimates of AICs from SFA LCM seem less precise
- Ray economies of scale are exhausted; there are product specific economies in UG teaching and in research
- There are diseconomies of scope

6. Conclusions

- It is important to take into account other characteristics of universities (observable and unobservable) in estimating cost functions – efficiency differences are much lower once this is done
- Where a HEI has a low efficiency score this is usually explained by reference to special features observed in that HEI (*eg.* small, specialist)
- Can the LCM adequately deal with the heterogeneity observed in English higher education?
